Data Flow Diagram

Create a Data Flow Diagram (DFD) to show how data moves through your system - between external entities, processes, and data stores. Use the symbol legend below as a guide.

Data Flow Diagram Symbol Overview

Symbol	Name	Description
Oval / Rounded shape	External Entity	The Customer enters application details. The Bank Credit Analyst reviews applications and predictions. The Compliance Officer checks high-risk applicants. The IBM Watson ML Service hosts the trained model and provides real-time predictions.
Rectangle with numbered header	Process	The system collects applicant details, validates and preprocesses the data, performs feature engineering, predicts approval using Logistic Regression, Random Forest, XGBoost, and Decision Tree, generates the approval or rejection result, and stores the prediction for future use.
Rectangle (solid fill, no number)	Data Store	The Applicant Database stores applicant information. The Trained ML Model stores the best-performing model. The Prediction Records store prediction results and applicant details.
Labeled arrow	Data Flow	Applicant information is collected and preprocessed. The processed data is sent to the ML model for prediction. The system generates an approval or rejection result and stores the records in the database.

Example

The diagram below illustrates how the symbols above come together to form a complete data flow diagram.
