

Coding & Solution

Date	29 June 2026
Team ID	xxxxxx
Project Name	Credit Card Approval Prediction
Maximum Marks	5 Marks

Coding & Solution :

This section evaluates the quality and completeness of your implemented code and the overall solution. Your submission should demonstrate working functionality, clean code practices, and alignment with your defined requirements.

Instructions:

1. Ensure your code is well-structured, commented, and follows best practices for your chosen technology stack.
2. The solution should address the core problem statement and implement the key functional requirements.
3. Include all source files, configuration files, and setup instructions needed to run the application.
4. Attach or link to your code repository (e.g., GitHub) in the table below.

Solution Summary :

Field	Details
Repository Link / URL	your GitHub Link
Programming Language(s)	Python , HTML , CSS , JavaScript
Framework(s) Used	Flask, Scikit-learn, XGBoost, Pandas, NumPy, IBM Watson Machine Learning .
Key Features Implemented	• Credit card approval prediction using Machine Learning . • Data preprocessing and feature engineering . • Model training using Logistic Regression, Random Forest, Decision Tree, and XGBoost. • Flask-based web application for real-time prediction . • IBM Watson Machine Learning deployment .
Pending / Incomplete Features	• User authentication. • Database integration. • Prediction history dashboard.
Setup / Run Instructions	1. Install dependencies (pip install -r requirements.txt) . 2. Run python app.py 3. Open the localhost URL. 4. Enter applicant details and click Predict.

Code Quality Checklist :

S.No	Criteria	Status (Yes / No)
1	Code is modular and organized into functions / classes	Yes
2	Meaningful variable and function names are used	Yes
3	Code includes comments / documentation where necessary	Yes
4	Error handling is implemented for critical operations	Yes
5	The application runs without critical errors	Yes
6	Code is committed to a version control repository	Yes

Additional Notes / Comments:

The project automates credit card approval using machine learning by comparing four classification algorithms and deploying the best-performing model through a Flask web application with IBM Watson Machine Learning for real-time predictions.
